

Machine Learning Human Rights and Wrongs

This repository contains replication materials for the paper, *Kevin Greene, Michael Colaresi, and Baekwan Park "Machine Learning Human Rights and Wrongs: How Supervised Learning Using Texts Can Inform the Debate about Changing Standards of Human Rights" in Political Analysis.*

For questions, contact Baekwan Park (baekwan.park@gmail.com)

Directory structure and Files (See Directory Structure Section)

- **code:** All the scripts to run the models and plot figures in the paper and the appendix.
- **data:** documents and annotated list for the documents
- **outputs:** all the outputs from the models
 - *console:* log outputs for models (.txt)
 - *model_output:* model outputs (.csv)
 - *plots:* plots (.pdf)
 - *vi_outputs:* variable importance outputs (.csv)

Requirements

- Python3
 - scikit-learn 0.19.1
 - SciPy 1.0.0
 - Numpy 1.13.3
- R 3.4.2

Setup and Executing the Scripts

1. Run Step by Step (Estimated Running Time: 30 hours)

- If you already have all the requirements listed above on your computer, you can run directly. If not, install the following softwares and packages:
 - Python3
 - scikit-learn 0.19.1

- SciPy 1.0.0
- Numpy 1.13.3
- R 3.4.2

- Make sure your current working directory is **REPLICATION_FILE**
- In the folder **REPLICATION_FILE**, you should be able to see the following subfolders and files.

```

1. bash
BP:REPLICATION_FILE BaekkwonPark$ ls
README.md      code          data          execute.sh    outputs       setup.sh
BP:REPLICATION_FILE BaekkwonPark$ █

```

- In the **code** folder, you have all the code. In your terminal, you can run them one by one in the following order.

First, run **main.py** file for python.

```

1. bash
BP:REPLICATION_FILE BaekkwonPark$ python ./code/main.py

```

Second, run **Rolling_Accuracy.R** file for Rscript.

```

1. bash
BP:REPLICATION_FILE BaekkwonPark$ Rscript ./code/Rolling_Accuracy.R

```

Third, run **Feature_Importance.R** file for Rscript.

```

1. bash
BP:REPLICATION_FILE BaekkwonPark$ Rscript ./code/Feature_Importance.R

```

- All the results and figures will be exported to **outputs** folder.

2. Run with Virtual Environment (Estimated Running Time: 30 hours)

- If you want to run with Python's virtual environment, first, make sure that you have Python3.

- Make sure your current working directory is **REPLICATION_FILE**
- There are two bash files: **setup.sh** and **execute.sh**. Simply run one by one, then it will run all the code.
- **setup.sh**: this will create a virtual environment for python and install all the requirements (scikit learn, numpy, scipy, etc.) to run the script.

```
$ ./setup.sh
```

- **execute.sh**: this will run all the models and plot figures.

```
$ ./execute.sh
```

Directory Structure (REPLICATION_FILE)

1. Folder Structure Only

In the **REPLICATION_FILE** folder, you can find the following sub-folders and instruction files.

```
REPLICATION_FILE
├── README.md
├── README.pdf
├── Figures_Table_in_the_Paper
├── setup.sh
├── execute.sh
├── code
├── data
├── outputs
│   ├── model_output
│   ├── console
│   │   ├── fixed_5
│   │   │   └── all
│   │   ├── fixed_10
│   │   │   ├── all
│   │   │   └── appendix_tables
│   │   └── sequential
│   ├── plots
│   └── vi_output
```

2. Files in Each directory and Comments

There are files and sub-directories in each directory.

REPLICATION FILE

- README.md:
This is the file that you are reading right now.
- setup.sh:
As explained above, this will **set up for python virtual environment and installing all the requirements.**
- execute.sh:
As explained above, by running this file, you run all the models and draw plots.
- Figures_Table_in_the_Paper.pdf:
This explains all the **input and output files used to generate tables and figures in the article.**
- code
 - main.py:
This **is the file** that runs all the models the paper. You **do not need to** run the rest **of** the code individually because they **are** all imported **and used as modules in** this file.
 - csv_sequence.py:
It calls the **raw documents from annotated_list to data_processing.**
 - data_processing.py:
It converts all the **raw documents into document term matrices for models.**
 - classifier.py:
It estimates all the models (classifiers) used **in** the article. (Naive Bayes, Logistic Regression, SVM, Random Forests)
 - model_testing.py
It runs all the classifiers **for rolling** window prediction.
 - voting_classifier.py
It runs majority vote classifier **for rolling** window predictions.
 - bias.py
It calculates **in-window and out-window bias for each** model.
 - random_forest_features.py
It calculates feature importance **for** random forests models.

- output.py
 - It writes, **save and export** all the results from each model in *.csv and *.txt format.
- Rolling_Accuracy.R:
 - It draws line plots **for** accuracies **for** all models.
- Feature_Importance.R:
 - It draw plots **for** feature importance outputs.
- requirements.txt:
 - This **is for** installing all the requirements **when using virtual** environment.
- **data**
 - documents:
 - This **directory** contains about **5,000** txt files **from** the State Department Reports (**1978 - 2010**).
 - annotated_list.csv:
 - This **file** lists classification labels **for** all the documents.
- **outputs**
 - model_output:
 - This folder contains results **from rolling** window predictions (**5 years and 10 years** respectively) **and sequential** window predictions (accuracy **and** bias **for each** window).
 - fixed_5_model_evaluation.csv:
 - This **is 5 year rolling** window **prediction** results.
 - fixed_10_model_evaluation.csv:
 - This **is 10 year rolling** window **prediction** results.
 - sequential_model_evaluation.csv:
 - This **is** forward **sequential** window **prediction** results.
- **console**
 - This **directory** contains **log** outputs **for** all the models. You can find all the outputs **for cross validation**, tuning **parameters**, various forms **of** evaluation metrics(**precision**, recall, F1, accuracies, confusion matrix, etc.)
 - fixed_5
 - all:
 - This contains all the **raw log** outputs **for fixed 5 year rolling** window prediction.
 - fixed_10
 - all:
 - This contains all the **raw log** outputs **for fixed 10 year**

rolling window prediction.

appendix_tables:

This folder contains all the **raw log** outputs used to create **Table 2** in the Appendix **and** the confusion matrices.

sequential:

This contains all the **raw log** outputs for **sequential rolling** window prediction.

plots:

This **directory** contains all the plots used **in** the paper.
(see "[Figures_Table_in_Paper.pdf](#)" **file** for detail.)

5_Rolling.pdf

10_Rolling_bw.pdf

10_Rolling.pdf

Seq_FWD.pdf

SimulatedAccuraciesOutAndIn.pdf

VarImpFullEarly1.pdf

VarImpFullLate1.pdf

VarImpMain_bw.pdf

VarImpMain_color.pdf

vi_output

This contains all the results **of** feature importance analysis.
